

HOW TO CHANGE A POWER SUPPLY

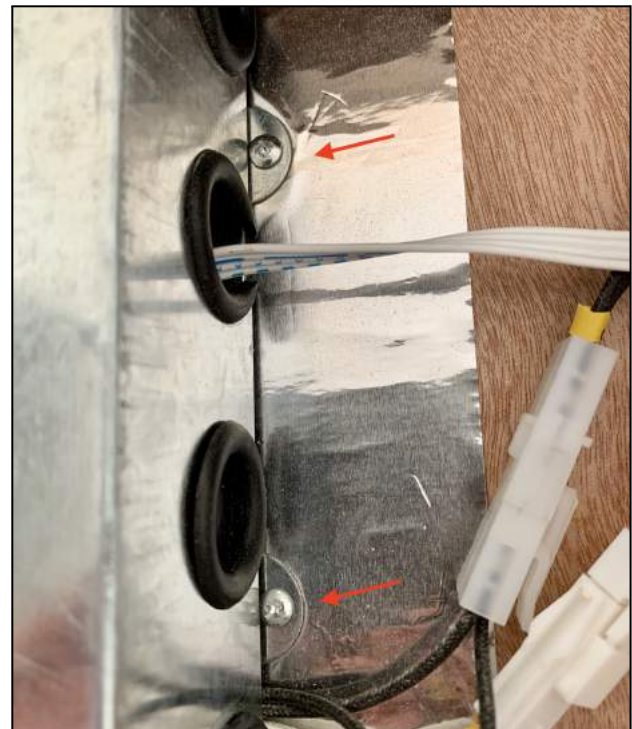

1. The power supply is a rectangular silver box (marked with a star in the photo). The power supply is found under the corresponding flap with the mesh square cut out.

2. Unscrew corresponding roof panels to gain access to the power supply. Unscrew the four screws that attach the old power supply to the sauna itself. **DO NOT** unhook any wire molex connectors or remove the old power supply just yet.

3. Take the new power supply and place it on top of the old power supply. Match the new power supply with the corresponding wires and cords coming out of the old unit. One side will have all male molex connectors and the other will have female molex connectors.

4. Match connector to connector. Unconnect each molex connector one at a time and connect it to the new unit. Once all connectors are connected to the new power supply, slide the old unit out, then screw down the new power supply to the Sauna.

5. Double check all molex connectors are firmly connected to the new power supply, before screwing back down the roof wood panels and closing any trap doors.
